Introduction:

Due to some reasons, many students do procrastination and face problems caused by it. Many students lack of proper concepts, resulting in missing deadlines for exam preparation. On the other hand, many teaching aspirants couldn't get tuition due to unavailability.

For these problems, a solution is required. Therefore, we propose the development of online learning & tutoring system.

In our platform, Admins will provide courses on various subjects given by instructors and student can view these courses. Thus, student can solve their procrastination problems. On the other hand, by selling courses, teacher can solve their unemployment problems.

Class Diagram

Entities & Attributes:

➔ **Student:** This entity represents the students who interact with the system.

Attributes:

- **id:** Unique identifier for each student.
- **name:** Name of the student.
- **email:** Email of the student.

Methods:

- **viewCourse(course: Course):** Allows the student to view a course.
- **enroll(course: Course):** Allows the student to enroll in a course.
- **leaveCourse(course: Course):** Enables the student to leave a course.

➔ **Admin:** This entity represents the system administrator responsible for managing courses.

Attributes:

- **id:** Unique identifier for each admin.
- **name:** Name of the admin.
- **email:** Email of the admin.

Methods:

- **createCourse(courseName: string, description: string): Course:** Allows the admin to create a new course.
- **updateCourse(course: Course):** Allows the admin to update details of an existing course.
- **deleteCourse(course: Course):** Enables the admin to delete a course.

➔ **Course:** This entity represents the courses offered within the system.

Attributes:

- **id:** Unique identifier for each course.
- **name:** Name of the course.
- **description:** Description of the course content.
- **status:** Current status of the course (e.g., Active, Inactive).
- **openForEnrollment:** Boolean flag indicating if enrollment is open.

Methods:

- **startCourse():** Marks the course as started or initiates it.

Installation and Setup

1. Install Python:

- Make sure that Python is installed in system. You can download it [here](#).
- Ensure that Python is added to your system's PATH during the installation process.

2. Install Virtual Environment (Optional but recommended):

- It's a good practice to use a virtual environment to isolate your project dependencies.
- Install the virtual environment package using pip:

```
pip install virtualenv
```

3. Create a Virtual Environment:

- Navigate to your project directory in the terminal/command prompt.
- Create a virtual environment using the following command:

```
virtualenv venv
```

4. Activate the virtual environment:

- On Windows:

```
venv\Scripts\activate
```

- On macOS/Linux

```
source venv/bin/activate
```

5. Clone the repository:

```
git clone https://github.com/taohidk99/EduHelp
```

6. Navigate to

```
cd smart-to-let-system
```

7. Install Python dependencies:

```
pip install -r requirements.txt
```

8. Run migrations:

```
python manage.py makemigrations
```

```
python manage.py migrate
```

9. Run Create a superuser (for admin access):

```
python manage.py createsuperuser
```

10. Run the development server:

```
python manage.py runserver
```

11. Access the Project:

- Open a web browser and navigate to <http://127.0.0.1:8000/> to view your Django project running locally.

Cloud Computing

Price: 2000.00

Description: Cloud Computing With changing times, the demands on technology have changed. In response different computing models have evolved since the past decade, starting with Cluster Computing to Grid Computing and finally to Cloud Computing. Cloud Computing has emerged as an important technique in the field of computer applications and information technology. It involves services for the storage, processing and transmission of data through shared resources, over the internet. Resources utilized for these services can be metered and the clients can be charged for the resources they utilize. Striving to provide a dynamic understanding of the nature of cloud computing this book begins with in-depth coverage of the fundamental concepts including Virtualization, Scaling and Service Oriented Architecture. The text further discusses cloud models such as NIST Model, Cloud Deployment Model and Service Delivery Models. Associated techniques like resource pooling, load balancing, and content delivery network are also presented in detail. The book concludes with a discussion on popular, commercial cloud services and real life applications including Amazon, Google and Microsoft Azure. It helps the reader correlate theory with practically available services. Designed for undergraduate and graduate students of computer science engineering and information technology, the book follows a structured approach to explain complex topics. A concluding chapter on mobile cloud computing and appendices on recent developments, including real-time processing and programming, in cloud computing are provided. Plenty of review questions, multiple choice questions, illustrations and comparison charts are interspersed throughout the text. Sandeep Bhowmik works as Assistant Professor in the Department of Computer Science & Engineering at Hooghly Engineering & Technology College, West Bengal. His areas of interest include application of soft computing techniques in data processing and information security
